Assembly Instructions for using the **LC120 Height Setter**

Position **Bolts** loosely on all the **Legs** leaving enough room for the **Rails** to fit.

Place 1st outer **Rail** into correct position on 2 sets of **Legs**.

Place **LC120 Height Setter** under middle of the **Rail** to keep a constant height.

Tighten **Bolts** with the **Rail** in place at the correct height.

Once the first **Rail** is in place, the above instructions need to be repeated on the other 5 **Rails** in order to get the frame at a constant height. Then its just a case of attaching the **Rail Arms** to the fitted **Rails** and placing the relevant tops onto the framework. The **LC120 Height Setter** can either be discarded or stored away for future use.
